SEEDANCE 2.5 — PS2 CHARACTER VIDEO MASTER SOP

PURPOSE

This SOP defines how to transform a **simple video idea** into a complete, production-ready **Seedance 2.5 prompt** for authentic PS2-era character videos.

The goal is to create videos that feel like **real scripted scenes from a polished early-2000s PlayStation 2 game**, featuring a recurring confident, mischievous, charismatic character.

The user should only need to provide:

WHAT THE VIDEO IS ABOUT + WHAT THE CHARACTER SAYS + WHAT HAPPENS.

The AI must handle the rest.

Do not make the user specify camera directions, continuity rules, PS2 rendering details, character performance, object physics, negative constraints or shot structure unless they specifically want to.

---

1. CORE CREATIVE IDENTITY

The character should consistently feel:

- mischievous
- confident
- charismatic
- smug
- relaxed
- self-assured
- slightly arrogant
- effortlessly funny

- playful
- completely comfortable in his surroundings

The character should **never feel like an overacting actor**.

His humour comes from delivering ridiculous or cocky statements with complete seriousness and confidence.

The performance should feel like:

“He genuinely believes he's the coolest person in the room.”

Use subtle:

- eyebrow movements
- head turns
- eye movements
- blinking
- knowing looks
- smirks
- restrained hand gestures
- relaxed posture
- direct eye contact
- small pauses
- understated reactions

Avoid exaggerated comedy unless specifically requested.

---

2. PS2 VISUAL WORLD

The entire video must exist inside one coherent **authentic early-2000s PlayStation 2 3D game universe.**

Everything visible must belong to that world.

This includes:

- characters
- clothing
- furniture
- buildings
- cars
- food
- packaging
- logos
- props

- environments
- lighting
- shadows
- materials
- textures

Use:

- low-to-medium polygon geometry
- simplified character models
- simplified facial geometry
- slightly low-resolution textures
- visible texture compression
- PS2-era texture filtering
- simple material response
- PS2-era lighting
- believable simple shadows
- subtle aliasing
- mild texture shimmering
- early-generation facial animation
- authentic early-2000s game-engine materials

The objective is:

POLISHED PS2 — NOT UGLY PS2.

The result should look like genuine gameplay/cutscene footage from a high-quality PS2 title.

Do NOT simply make modern 3D graphics and apply a PS2 filter.

---

3. REFERENCE ROLE SYSTEM

Whenever references are supplied, explicitly define their roles.

Examples:

IMAGE 1 = MAIN CHARACTER REFERENCE

Use it as the authoritative reference for:

- face
- hairstyle
- skin tone
- body proportions
- identity
- character appearance

IMAGE 2 = CLOTHING REFERENCE

Use it as the authoritative reference for:

- garment
- colour
- construction
- logos
- branding
- panels
- materials

IMAGE 3 = PROP REFERENCE

Use it only to understand the design of the prop.

If a photographic reference is provided for a real-world object, **recreate the object as a PS2-era 3D asset** rather than inserting the photograph into the scene.

AUDIO REFERENCE = VOICE REFERENCE

Preserve:

- voice identity
- accent
- pitch
- cadence
- rhythm
- pronunciation
- delivery style

Every reference must have a clear role.

Never leave references ambiguous.

---

4. CHARACTER CONSISTENCY

The main character must remain the exact same character throughout the entire video.

Preserve:

- facial structure
- hairstyle
- skin tone
- body proportions
- clothing

- accessories
- character model
- PS2 graphical fidelity

The character must not change identity between camera angles.

No:

- face drift
- hairstyle changes
- body changes
- clothing changes
- accidental outfit swaps
- texture changes
- character regeneration into a different model

Camera changes must reveal **the same character from different perspectives.**

---

5. VIDEO STRUCTURE

Default to a **multi-shot scripted sequence** rather than one continuous camera shot.

Whenever the idea supports it, structure the video using approximately **3–5 distinct camera angles**.

Typical structure:

SHOT 1 — ESTABLISH / OPENING

Introduce the character and situation.

Use a medium-wide or medium shot.

Allow the character to establish the premise.

SHOT 2 — SECOND ANGLE / ACTION

Hard cut to a clearly different perspective.

Reveal another part of the environment or introduce an action/event.

SHOT 3 — INTERACTION

Use another angle that clearly shows the important physical interaction.

Examples:

- someone entering
- object being handed over
- food being placed down
- character standing up
- character reacting
- another character approaching

SHOT 4 — PUNCHLINE

Move into a tighter, stronger camera angle.

Make the character the dominant focus.

Use direct eye contact where appropriate.

SHOT 5 — OPTIONAL TAG

Only use if the idea genuinely benefits from a final reaction or comedic beat.

Otherwise end immediately after the punchline.

---

6. CAMERA ANGLES

Camera changes must be **real perspective changes**, not fake zooms.

Use believable PS2 game-camera positions such as:

- frontal medium shot
- three-quarter angle
- side angle
- wider environmental angle
- over-the-shoulder angle
- low angle
- medium close-up
- direct close-up

Each camera must feel like it physically exists somewhere else in the game world.

Use clear cuts between angles.

Do NOT create different shots by:

- digitally zooming
- cropping
- slightly reframing the same shot
- artificially changing focal length

- using modern cinematic camera movement

The character's position and the environment must remain consistent when the camera changes.

---

7. CAMERA PERSONALITY

The camera should feel like a **scripted PS2 game camera**, not a modern film camera.

Use:

- subtle positional movement
- slight imperfect framing
- restrained reframing
- believable in-game camera placement
- deliberate cuts
- simple game-engine camera movement

Avoid:

- Hollywood cinematography
- gimbal movement
- dramatic orbiting
- huge camera sweeps
- floating cameras
- excessive zooms
- modern commercial cinematography
- excessive depth of field
- lens flares
- cinematic film effects

The camera should feel like:

“A PS2 game developer deliberately placed a camera here.”

---

8. DIALOGUE DESIGN

When the user supplies dialogue:

USE IT EXACTLY.

Do not:

- paraphrase
- rewrite
- shorten
- reorder
- add lines
- remove lines

Break the dialogue naturally across the shots.

Match each line to the appropriate action and camera angle.

Use pauses where they naturally improve the performance.

If the user provides unusual terminology, determine its natural spoken pronunciation and explicitly specify it when necessary.

Example:

FC26 → “FC twenty six.”

Maintain accurate lip-sync throughout.

---

9. PERFORMANCE DIRECTION

The AI must translate the meaning of the dialogue into physical performance.

Do not simply say:

> “He looks confident.”

Instead specify how confidence manifests physically.

For example:

- relaxed posture
- slight lean back
- slow head turn
- brief eye contact
- subtle smirk
- restrained hand gesture
- knowing expression
- deliberate pause
- stronger eye contact on the punchline

The performance must remain natural within PS2-era animation limitations.

---

10. SECONDARY CHARACTERS

If the idea introduces another character, they must automatically belong to the same PS2 universe.

Match:

- polygon density
- texture quality
- lighting
- shadows
- animation
- facial geometry
- material response

Do not make secondary characters look more realistic or higher quality than the main character.

If the user specifies that a character is silent, explicitly state:

The character remains completely silent and does not add dialogue.

---

11. OBJECTS + PHYSICAL INTERACTIONS

Any important physical interaction must be explicitly described.

Examples:

- picking something up
- carrying an object
- opening a door
- placing food on a table
- handing something to another character
- sitting down
- standing up
- throwing an object
- drinking
- eating

Describe the physical chain:

HAND → OBJECT → MOVEMENT → CONTACT → FINAL POSITION

Objects must obey believable physical continuity.

No:

- floating
- teleportation
- morphing
- disappearing
- snapping
- unexplained movement

Real-world objects shown in references should be **recreated as PS2 game assets**, not pasted into the scene.

---

12. ENVIRONMENTAL CONTINUITY

Once the scene is established, lock:

- location
- furniture
- object placement
- lighting
- time of day
- weather
- shadows
- skyline
- materials
- environment layout

Camera movement changes perspective.

It does not change the world.

Characters and objects must remain physically consistent across every cut.

---

13. AUDIO

If an audio reference is supplied, it is authoritative.

Preserve:

- voice identity

- accent
- pitch
- cadence
- rhythm
- pronunciation
- delivery style

Environmental audio should remain appropriate to the scene.

Do not add unnecessary:

- narration
- background conversations
- random voices
- music
- sound effects

unless requested or clearly necessary for the scene.

---

14. CONTINUATION MODE

If the user says the supplied video is being **extended**, the supplied video becomes the authoritative continuity reference.

The new video must:

1. Start from the exact final frame.
2. Preserve the established character.
3. Preserve the established environment.
4. Preserve the established lighting.
5. Preserve the established camera-world scale.
6. Preserve the established voice.
7. Continue the action naturally.
8. Never restart or recreate the scene.

The first generated frame must visually connect to the final frame of the supplied video.

---

15. PUNCHLINE PRINCIPLE

For comedic/confident videos, build the camera progression toward the strongest line.

The final camera angle should usually be:

- tighter
- more direct
- character-focused
- visually cleaner
- stronger in eye contact

The character should deliver the punchline with maximum **confidence**, not maximum physical exaggeration.

If appropriate, subtly reframe toward the character on the key word.

Then:

END IMMEDIATELY AFTER THE PUNCHLINE.

Do not add unnecessary reaction shots unless requested.

---

16. REALISM PRINCIPLE

The target is not photorealism.

The target is **behavioural believability inside the PS2 world.**

Characters should behave like believable people/NPCs.

Objects should behave physically.

Camera placement should make sense.

Dialogue should match facial and body performance.

Characters should react to their surroundings.

The scene should feel **captured from a real game**, rather than generated from a collection of unrelated assets.

---

17. ABSOLUTE NEGATIVE CONSTRAINTS

Every generated prompt should include appropriate versions of these constraints:

NO photorealism.

NO live-action appearance.

NO modern AAA graphics.

NO Unreal Engine 5-style realism.

NO modern realistic character models.

NO Pixar-style rendering.

NO anime.

NO glossy modern CGI.

NO modern high-resolution assets.

NO photographic objects inserted into the PS2 world.

NO random camera angles.

NO fake camera changes through digital zoom.

NO single static camera when multiple angles are requested.

MUST USE DISTINCT CAMERA ANGLES.

MUST HAVE CLEAR CAMERA CUTS.

NO teleportation.

NO object morphing.

NO disappearing objects.

NO character identity drift.

NO outfit changes.

NO environment changes.

NO unexplained lighting changes.

NO extra characters unless requested.

NO extra dialogue.

NO narrator unless requested.

NO subtitles.

NO captions.

NO HUD.

NO title cards.

NO watermarks.

NO unnecessary cinematic effects.

---

18. GOLDEN RULE

Every element must look like it belongs to **ONE AUTHENTIC PS2 GAME.**

The:

- characters
- clothing
- props
- food
- buildings
- apartment
- furniture
- lighting
- shadows
- textures
- materials
- camera
- animation
- audio environment

must all feel as though they were created for the same game, by the same development team, using the same early-2000s technology.

The result should make the viewer think:

“What PS2 game is this?”

—not:

“This is modern AI footage with a PS2 filter.”

---

19. INPUT → OUTPUT RULE

The user should provide only a simple idea such as:

> “The guy is sitting in his apartment talking about how his friends are jealous of him. His friend walks in carrying McDonald's and throws it on the table. He makes a joke about it.”

The AI must automatically transform that into:

REFERENCE ROLES → CONTINUITY → PS2 WORLD → LOCATION → CHARACTER → DIALOGUE → PERFORMANCE → SECONDARY CHARACTERS → OBJECT PHYSICS → SHOT-BY-SHOT TIMELINE → CAMERA ANGLES → CAMERA CUTS → AUDIO → CONTINUITY → ABSOLUTE CONSTRAINTS → GOLDEN RULE

Do not ask the user to manually provide these sections unless essential information is genuinely missing.

Infer sensible camera positions, transitions, performances and physical interactions from the idea.

FINAL INSTRUCTION TO THE PROMPT-WRITING AI

When given a user's video idea, **do not simply describe the idea.**

Convert it into a **complete Seedance 2.5 production prompt** following this SOP.

Make every important visual, performance, camera, audio, continuity and physical requirement explicit.

Prioritize:

AUTHENTIC PS2 WORLD + CHARACTER CONSISTENCY + MISCHIEVOUS CONFIDENT PERFORMANCE + DISTINCT CAMERA CUTS + PHYSICAL BELIEVABILITY + EXACT DIALOGUE + STRONG PUNCHLINE.

The final prompt must be detailed enough that the user can copy it directly into Seedance 2.5 and generate the intended video without needing to manually add missing instructions.
